<u>Manual:</u>

The tool is mostly automated, the program was made in mind of the examiner needing to make as minimal amendments to it as possible, thus simply running the program will perform all tests: Baseline, 1-Phase MNB, 2-Phase MNB and output all results to external CSV files in the Results folder of the source code.

At the end of each test two CSV files are created in the 'Results' folder titled {1/2phase}_{dataset}_{model name}_{RAWDATA/nothing} based on the specific model being ran and dataset being implemented. Within the results folder already are subfolders named after the model training data they house. These are the figures I retrieved through my own testing which I have left for you to verify consistency of your results with

 Should there be any error in the read/output of CSV that requires using a direct pathway to the file. CSV read/writes are only performed in the dfCycle & logTest functions.
